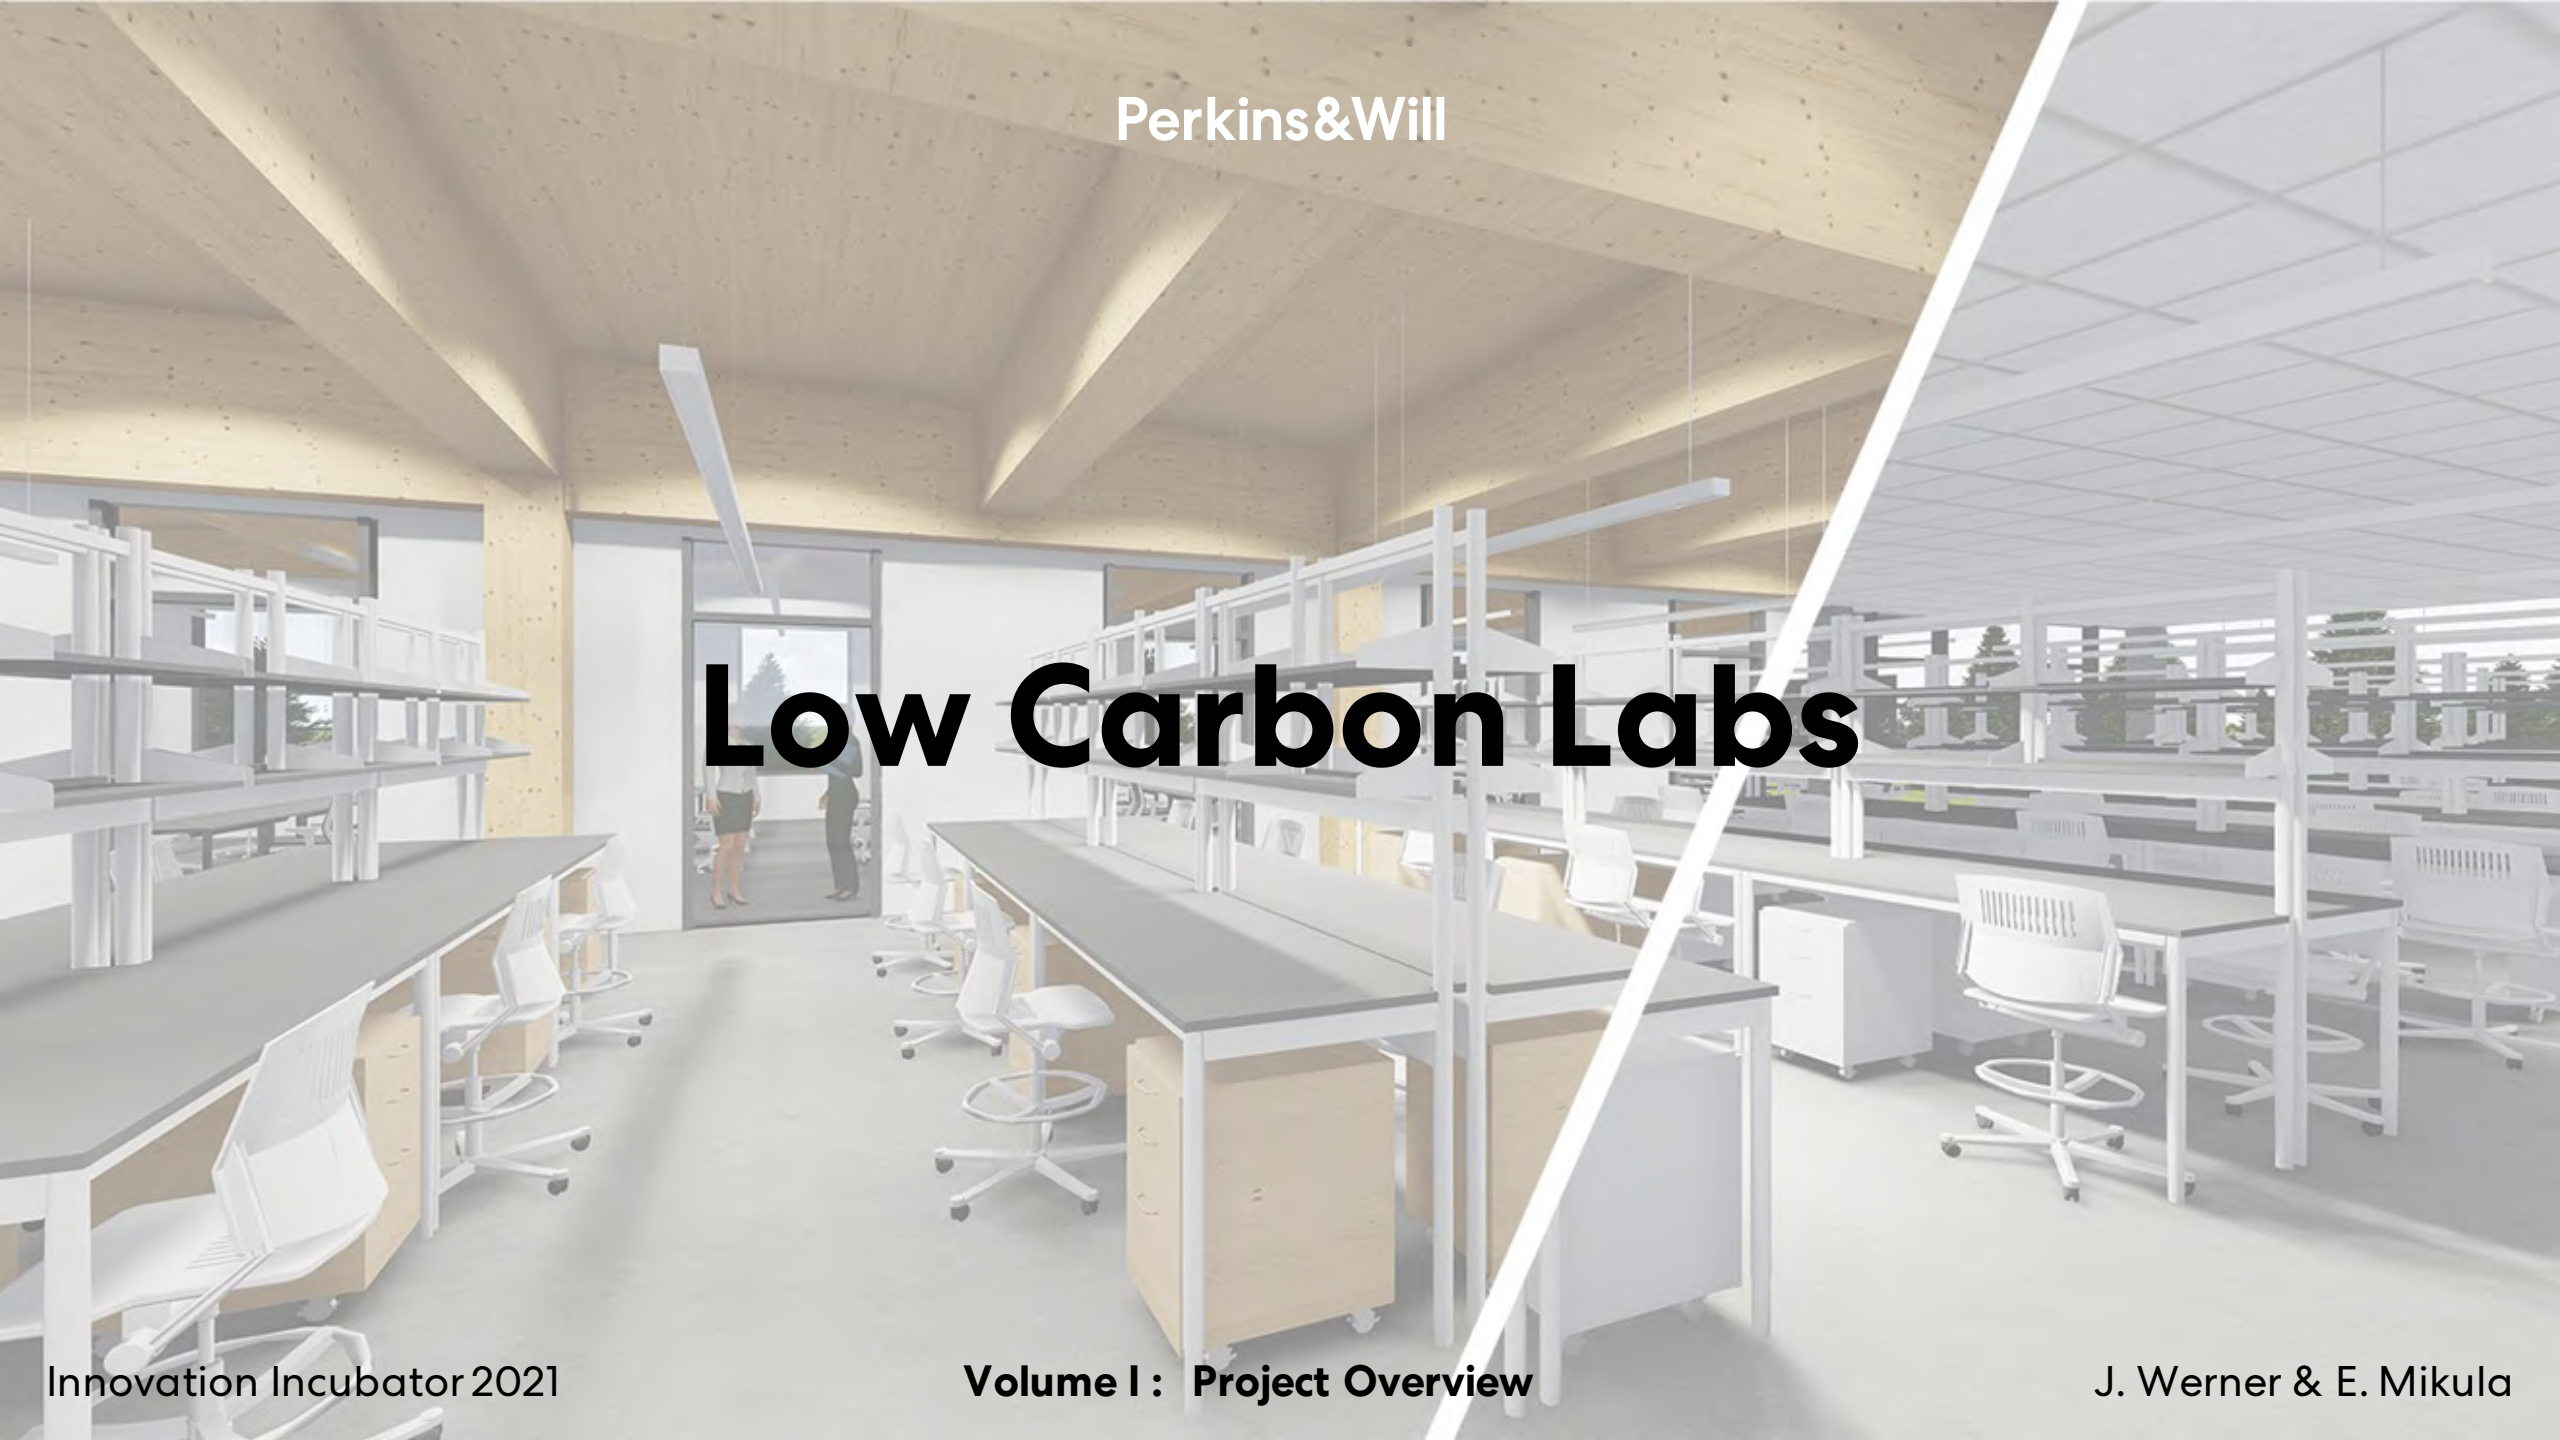
Perkins&Will

Low Carbon Labs



Innovation Incubator 2021

Volume I : Project Overview

J. Werner & E. Mikula

Low Carbon Labs - Executive Summary

Why Laboratory Embodied Carbon ?

EMBODIED CARBON - TECHNICAL BUILDINGS

LCA tools have experienced a renaissance, enabling an increasing focus on the embodied carbon impacts of structural materials in light commercial, multifamily, and residential applications. But little is known about the embodied carbon intensity of other building types and systems.

Improved design resources will enable us to make better choices at earlier design phases, leading to more beautiful design, better occupant outcomes, and less impact to our fragile climate.

WHY LABS ?

Labs are designed to support discovery and innovation. Their designs can serve as models for innovation in buildings of all types.

Lab building embodied carbon is significant, due to the intensive structure, finishes, and mechanical systems of these buildings. For example: lab building structural systems are heavier per square foot than office or residential structures, due to their vibration performance. And lab building finishes and built-in casework are significantly more robust than office equivalents.

But hard data is lacking on the embodied carbon intensity of labs and technical buildings that would allow us to quantify these differences.

LABS RE-IMAGINED

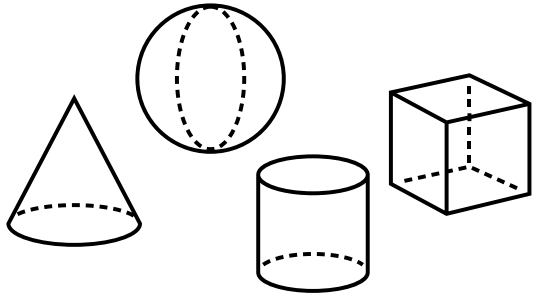
A standard kit of parts for lab planning and lab materials choices has emerged over the past 50+ years. Lab designers have become familiar with a predictable set of choices applying to many projects.

Recent projects show experimentation with a variety of design choices uncommon in laboratory buildings, such as CLT / Timber structural systems, low-carbon concrete, wood cladding, timber curtain wall, and demountable partitions. But no resource brings these experiments into a common framework for evaluating their carbon benefits.

Our goal is to daylight these strategies, quantify their benefits, and advocate for broader adoption. Our hope is this transforms how - and what - we design.

Low Carbon Labs - Executive Summary

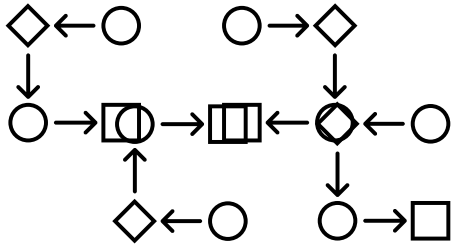
Caveats



“all models are wrong but some models are useful”

It has been said that "all models are wrong but some models are useful." In other words, any model is at best a useful fiction ... Nevertheless, enormous progress has been made by entertaining such fictions and using them as approximations. - George Box, Statistical Control: By Monitoring and Feedback Adjustment, 1997

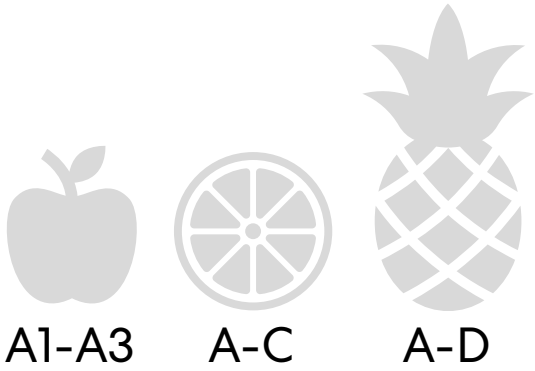
Low Carbon Labs is a simplified model of building systems. It does not include all the systems and products required to make a lab building. But it does demonstrate a method for evaluating individual design choices to improve future projects. We hope that the methods and examples help building owners and designers to contextualize the carbon impact of design choices alongside other conventional project drivers, such as scope, schedule, and cost.



Complexity

A key lesson of the study is the surprising difficulty of conducting embodied carbon analysis. There are numerous obstacles, including:

- Lack of EPD data for many products
- Wide variation in EPD scope and format
- Difficulty obtaining quantity takeoffs from design software
- Complexity of conversions between design software units and EPD reporting units
- Complexity of summarizing data across many product categories and creating holistic dashboards
- EC analysis software tools are still developing



Apples, Oranges, and Pineapples

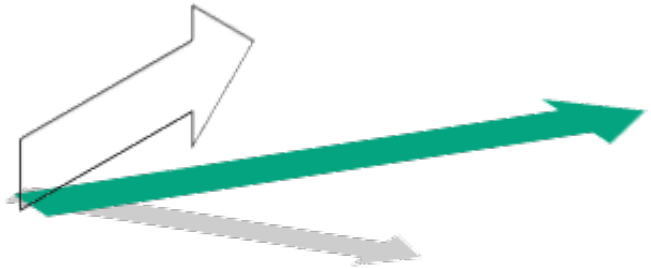
This study intentionally mixes EPD data from a variety of sources with different Product Category Rules (PCRs), modules (aka. product life cycle stages), and EPD types (ex. product specific vs. industry average).

This is out of necessity. Quality EPD data is sorely lacking for many individual products and, in some cases, for whole product categories.

To maintain “fairness” in comparisons between individual system selections, we have held the calculations within each system to consistent rules (for example, using consistent A1-A3 scope and product specific EPDs).

Low Carbon Labs - Executive Summary

Caveats

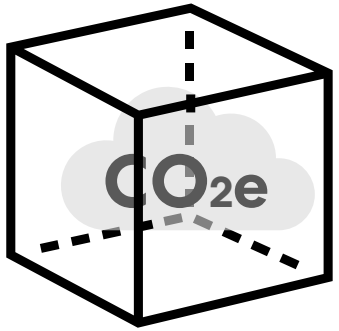


Directionality vs. Magnitude

This analysis represents a set of design choices, not a complete embodied carbon assessment of a laboratory building.

The complexity and difficulty of assessing just the products and systems included within this study belie the extraordinary difficulty of summarizing the complete Embodied Carbon picture of any building, let alone one as complex as a laboratory.

This leaves us unable to compare the total impact of various systems or design choices relative to the total Embodied Carbon impact of a whole building. For example, we are unable to say "Structure represents X% of a lab building's Embodied Carbon", because we don't know what a lab building's total embodied carbon is. Nobody does.



So what can we say about Embodied Carbon?

This study shows that many design choices have significant Embodied Carbon impact that can be easily compared to a building's Operational Carbon profile from an energy model or utility meters.

While the absolute magnitude of carbon reduction is debatable, the results clearly show that Embodied Carbon reduction options exist that are equivalent to years (or even decades) of Operational Carbon pollution.

As we have effective design choices to reduce Operational Carbon due to building energy use and building energy fuel source choices, we also have effective design choices to reduce Embodied Carbon due to building construction materials, systems, and methods.

Choose your own adventure

Is "Reimagined" right for my project?

We recognize that not all options will be possible for every laboratory project. Program differences, code / jurisdictional issues, and scope / schedule / budget drivers may place one or several system choices out of reach for a particular project.

So, we have deliberately structured "Low Carbon Labs" as a "choose your own adventure" of system-by-system choices. This has two advantages:

1. Teams can pick and choose individual options as the opportunity arises to make small, medium, or large improvements on a particular project.
2. Teams can adapt the method to evaluate additional systems, options, or choices specific to their particular interests.

Low Carbon Labs - Executive Summary

Scope and Results

SCOPE AND SYSTEMS

This study uses a 22' wide x 88' long x 1 story (15' high) "module". The 22' width reflects 2x 11' wide lab aisles. The 88' depth is composed of a 33' structural bay for computing / office work, a 33' bay for wet bench ("open lab") work, and a 22' bay for laboratory support / instrument work. This module provides a cross section of typical laboratory building space types.

The study evaluates (3) choices for each of (14) different building systems: superstructure for office and lab; building envelope (wall backup, insulation, cladding, and glazing); interior partitions; doors; floor finishes for office and labs; ceilings for office and labs; lab equipment (fumehoods); chairs; systems furniture; lab casework cabinets and countertop.

For some systems (ex. flooring), we were able to find many EPDs; thus, the challenge was picking realistic system options from many choices. For other systems (ex. lab countertops), very few EPDs were available, leading to limited system options.

SCENARIOS

The 3 scenarios (Baseline, Improved, Reimagined) are summaries of individual choices within each system type, aggregated. They don't necessarily represent a specific design case. Rather, they capture the potential for savings along a continuum of design choices. Still, the scenarios are useful to explain the potential of the individual choices when combined at the scale of a building.

The **Baseline** scenario provides a point of reference, with many system choices that can be found in conventional laboratory buildings.

Improved represents realistically achievable improvements that may be found in progressive projects.

Reimagined represents the better choices that we discovered for each system within the scope of the research study.

RESULTS

Baseline: The sum of the studied systems within the 22x88 module equates to ~175,000 kg CO2e/sf.

Improved: The sum of the studied systems within the 22x88 module equates to ~130,000 kg CO2e/sf, or a reduction of 26% from the baseline. The savings is equivalent to 2-7 years of operational carbon.

Reimagined: The sum of the studied systems within the 22x88 module equates to ~50,000 kg CO2e/sf, or a reduction of 73% from the baseline. The savings is equivalent to 7-20 years of operational carbon.

Context

Note: the "module" represents "net" program area of lab space. A real building would contain "gross" areas such as corridors, stairways, mechanical spaces, and storage. These may equate to 35-50% of the total building area included in the operational carbon assessments. So, the comparison of embodied carbon reduction to operational carbon may be diluted by a similar factor in practice.

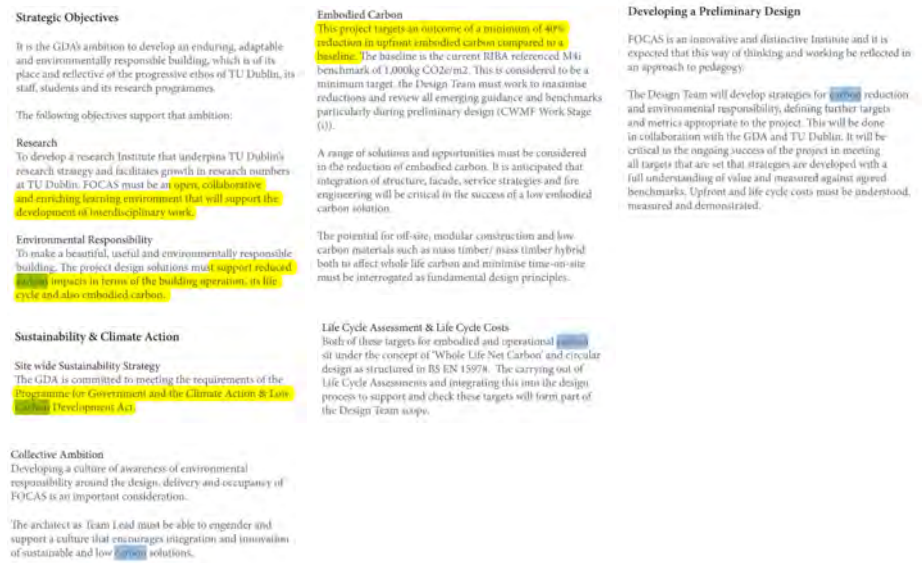
Who's Asking?

FOCAS

Technical University Dublin

Ireland, 2020

Competition Brief - Stage I



Strategic Objectives

It is the GDA's ambition to develop an enduring, adaptable and environmentally responsible building, which is of its place and reflective of the progressive ethos of TU Dublin, its staff, students and its research programmes.

The following objectives support that ambition:

Research

To develop a research Institute that underpins TU Dublin's research strategy and facilitates growth in research numbers at TU Dublin. FOCAS must be an open, collaborative and enriching learning environment that will support the development of interdisciplinary work.

Environmental Responsibility

To make a beautiful, useful and environmentally responsible building. The project design solutions must support reduced carbon impacts in terms of the building operation, its life cycle and also embodied carbon.

Sustainability & Climate Action

Site wide Sustainability Strategy

The GDA is committed to meeting the requirements of the Programme for Government and the Climate Action & Low Carbon Development Act.

Collective Ambition

Developing a culture of awareness of environmental responsibility around the design, delivery and occupancy of FOCAS is an important consideration.

The architect as Team Lead must be able to engender and support a culture that encourages integration and innovation of sustainable and low carbon solutions.

Embodied Carbon

This project targets an outcome of a minimum of 40% reduction in upfront embodied carbon compared to a baseline. The baseline is the current RIBA referenced M4i benchmark of 1,000kg CO2e/m2. This is considered to be a minimum target. the Design Team must work to maximise reductions and review all emerging guidance and benchmarks particularly during preliminary design (CWMF Work Stage (i)).

A range of solutions and opportunities must be considered in the reduction of embodied carbon. It is anticipated that integration of structure, façade, service strategies and fire engineering will be critical in the success of a low embodied carbon solution.

The potential for off-site, modular construction and low carbon materials such as mass timber/ mass timber hybrid both to affect whole life carbon and minimise time-on-site must be interrogated as fundamental design principles.

Life Cycle Assessment & Life Cycle Costs

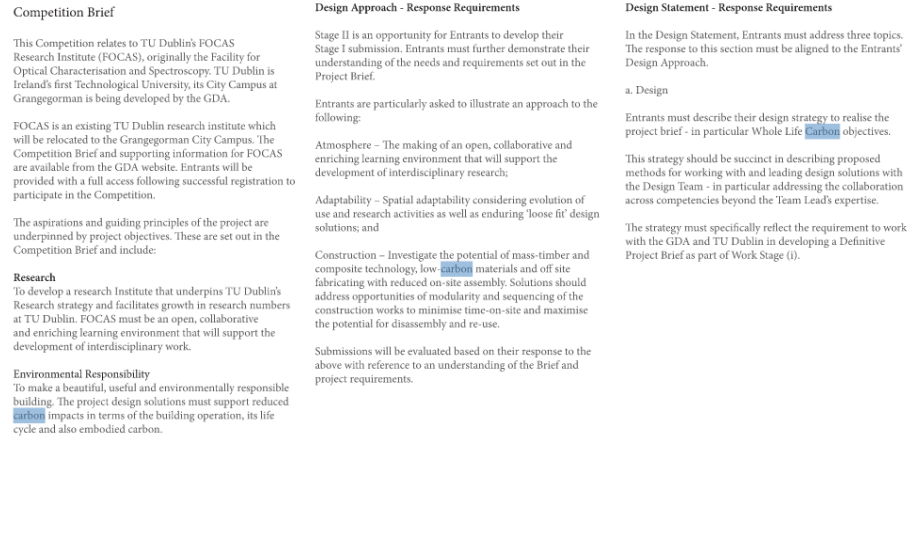
Both of these targets for embodied and operational carbon sit under the concept of 'Whole Life Net Carbon' and circular design as structured in BS EN 15978. The carrying out of Life Cycle Assessments and integrating this into the design process to support and check these targets will form part of the Design Team scope.

Developing a Preliminary Design

FOCAS is an innovative and distinctive Institute and it is expected that this way of thinking and working be reflected in an approach to pedagogy.

The Design Team will develop strategies for carbon reduction and environmental responsibility, defining further targets and metrics appropriate to the project. This will be done in collaboration with the GDA and TU Dublin. It will be critical to the ongoing success of the project in meeting all targets that are set that strategies are developed with a full understanding of value and measured against agreed benchmarks. Upfront and life cycle costs must be understood, measured and demonstrated.

Competition Regulations



Competition Brief

This Competition relates to TU Dublin's FOCAS Research Institute (FOCAS), originally the Facility for Optical Characterisation and Spectroscopy. TU Dublin is Ireland's first Technological University, its City Campus at Grangegorman is being developed by the GDA.

FOCAS is an existing TU Dublin research institute which will be relocated to the Grangegorman City Campus. The Competition Brief and supporting information for FOCAS are available from the GDA website. Entrants will be provided with a full access following successful registration to participate in the Competition.

The aspirations and guiding principles of the project are underpinned by project objectives. These are set out in the Competition Brief and include:

Research

To develop a research Institute that underpins TU Dublin's Research strategy and facilitates growth in research numbers at TU Dublin. FOCAS must be an open, collaborative and enriching learning environment that will support the development of interdisciplinary work.

Environmental Responsibility

To make a beautiful, useful and environmentally responsible building. The project design solutions must support reduced carbon impacts in terms of the building operation, its life cycle and also embodied carbon.

Design Approach - Response Requirements

Stage II is an opportunity for Entrants to develop their Stage I submission. Entrants must further demonstrate their understanding of the needs and requirements set out in the Project Brief.

Entrants are particularly asked to illustrate an approach to the following:

Atmosphere – The making of an open, collaborative and enriching learning environment that will support the development of interdisciplinary research;

Adaptability – Spatial adaptability considering evolution of use and research activities as well as enduring 'loose fit' design solutions; and

Construction – Investigate the potential of mass-timber and composite technology, low-carbon materials and off site fabricating with reduced on-site assembly. Solutions should address opportunities of modularity and sequencing of the construction works to minimise time-on-site and maximise the potential for disassembly and re-use.

Submissions will be evaluated based on their response to the above with reference to an understanding of the Brief and project requirements.

Design Statement - Response Requirements

In the Design Statement, Entrants must address three topics. The response to this section must be aligned to the Entrants' Design Approach.

a. Design

Entrants must describe their design strategy to realise the project brief - in particular Whole Life Carbon objectives.

This strategy should be succinct in describing proposed methods for working with and leading design solutions with the Design Team - in particular addressing the collaboration across competencies beyond the Team Lead's expertise.

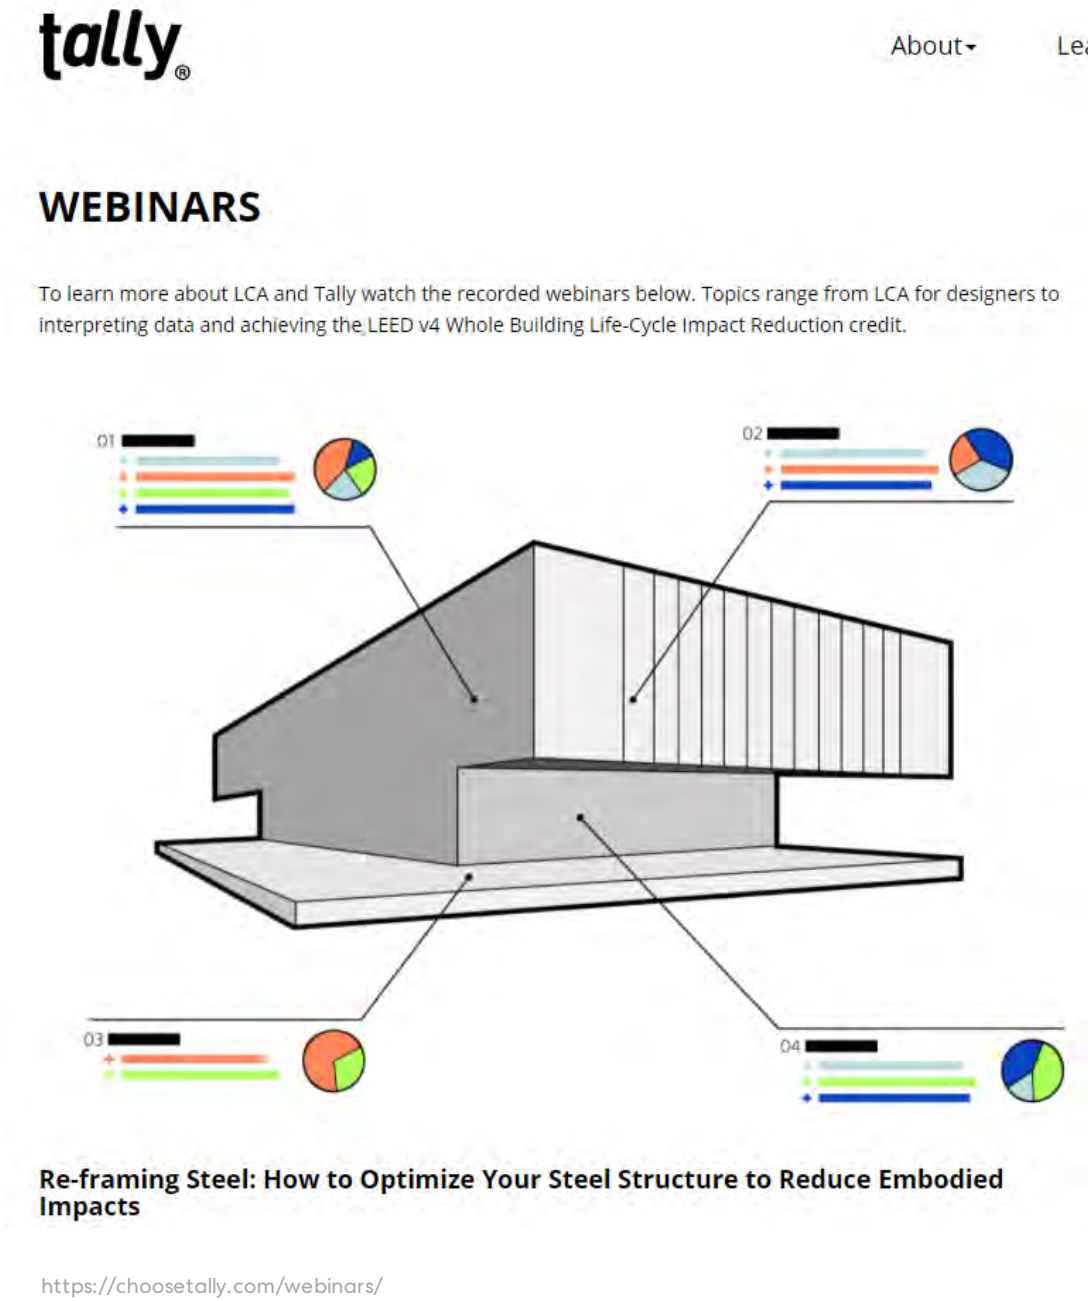
The strategy must specifically reflect the requirement to work with the GDA and TU Dublin in developing a Definitive Project Brief as part of Work Stage (i).

How We Thought We'd Do It

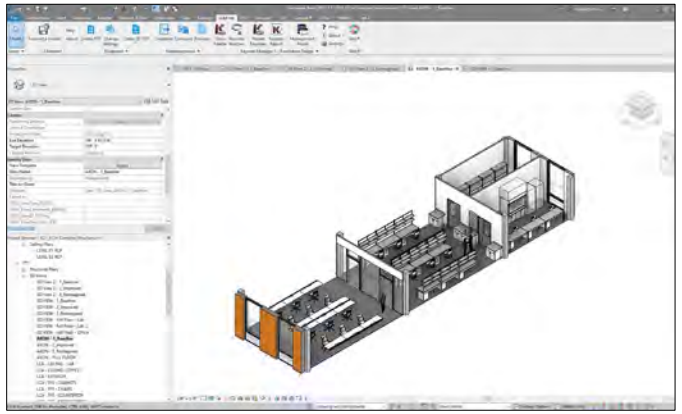
Tally

Tally, a tool originally developed by Kieran Timberlake, “allows Revit users to imbue their BIM with the complete information about the building materials and architectural products their structures will ultimately contain. Tally quantifies a building or material's embodied environmental impacts to land, air, and water systems...Tally gives its users the power to conduct whole building LCAs during design and to use LCA data to run comparative analyses of various design options that show their differing environmental impacts. ”

- https://kierantimberlake.com/page/tally

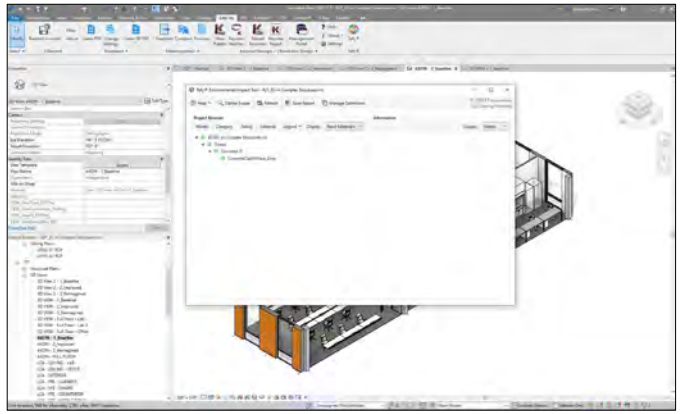


Low Carbon Labs



Model in Revit

Model lab module in Revit, utilizing design options to include Baseline, Improved and Reimagined scenarios

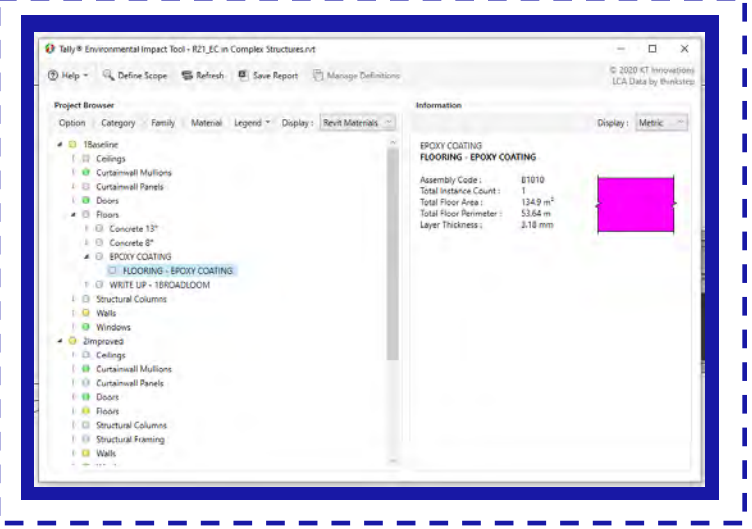


Use Tally to Assign Materials

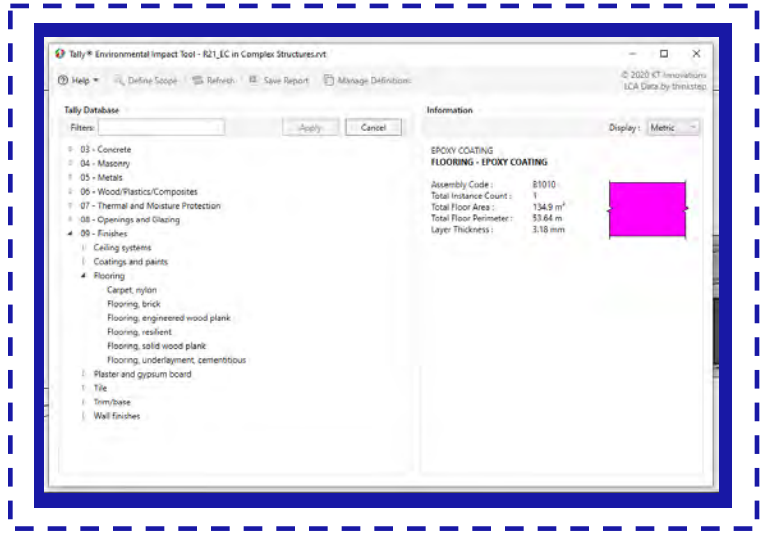
Utilizing Tally Revit Plug-in, assign materials aligned with materials specified in Laboratory projects

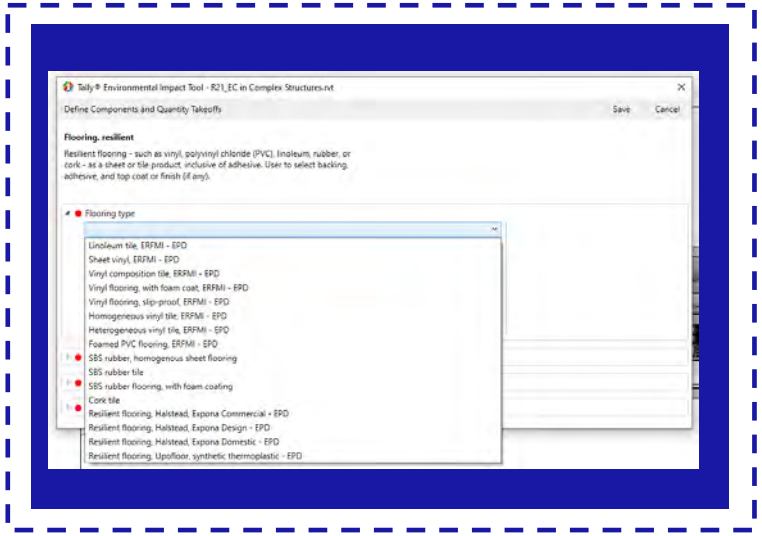
Report produced by Tally for Material Assessment

Tally



Material Categories currently available in Tally cover some, but not all categories relevant to an embodied carbon in laboratories analysis.

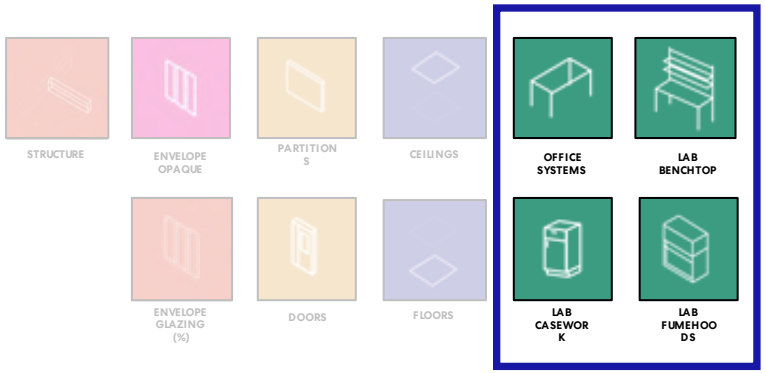




For available categories, material options currently available in Tally do not yet include the laboratory finishes typically specified.

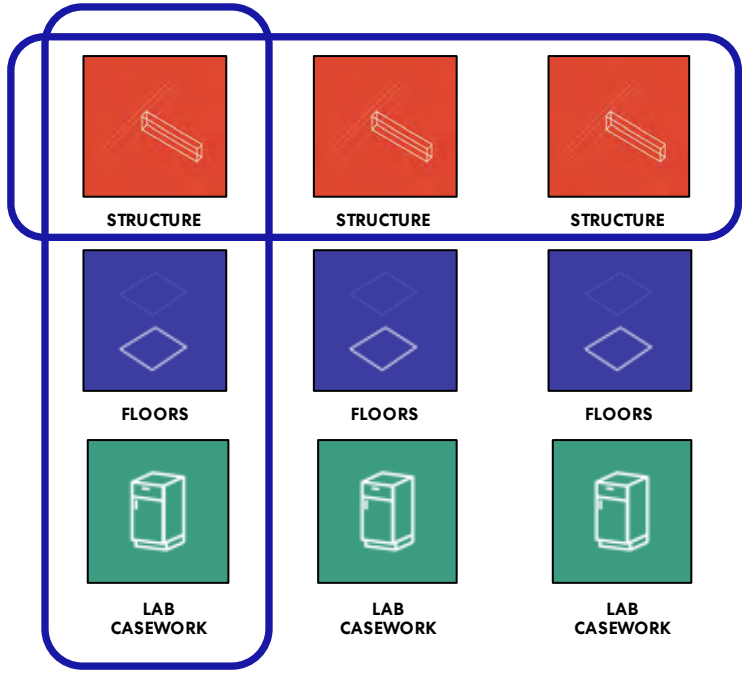
Tally

Tally



Whole systems not available in Tally – lab casework, equipment, office/writeup furniture systems.

When the system is available, the products we specify aren't available – flooring is available to analyze, but not the flooring we are looking to analyze.



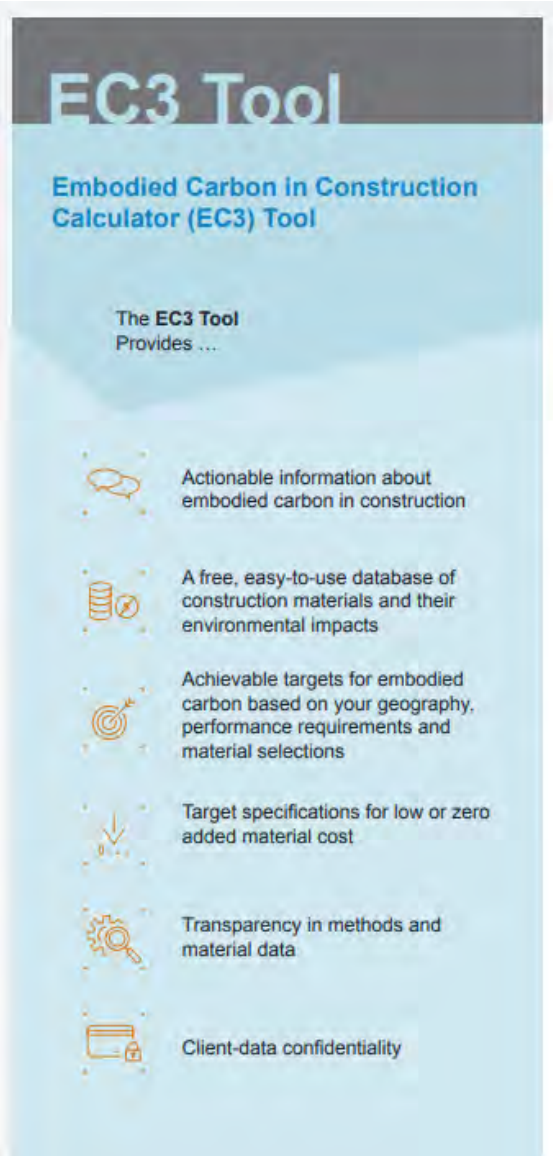
Tally assessment is geared towards whole-building LCA – could not review system by system, to understand individual impact of specific material choice.

EC3

“The Embodied Carbon in Construction Calculator (EC3) tool, is a ...tool that allows benchmarking, assessment and reductions in embodied carbon, ...The EC3 tool ...utilizes building material quantities from construction estimates and/or BIM models and a robust database of digital, third-party verified Environmental Product Declarations (EPDs).

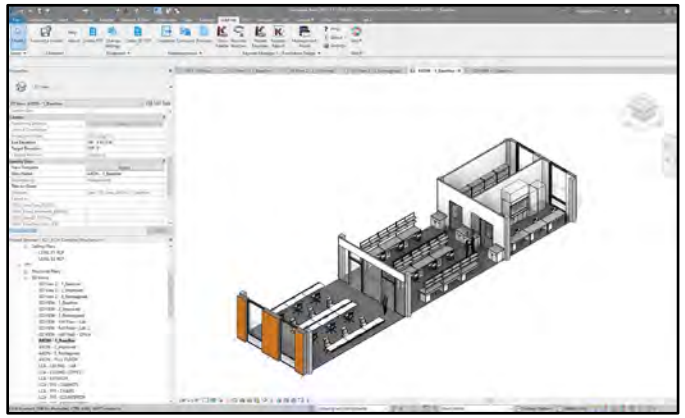
The tool and its subsequent effect on the industry is driving demand for low-carbon solutions and incentivizing construction materials manufacturers and suppliers to invest in disclosure, transparency and material innovations that reduce the carbon emissions of their products.”

- https://carbonleadershipforum.org/what-we-do/initiatives/ec3/

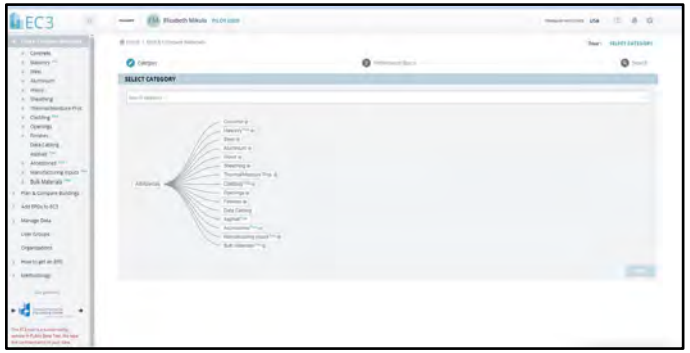


https://buildingtransparency-live-87c7ea3ad4714-809eeaa.divio-media.com/filer_public/61/f3/61f3b402-7627-402b-82ee-3619eb91525e/ec3_product_brief_pdf.pdf

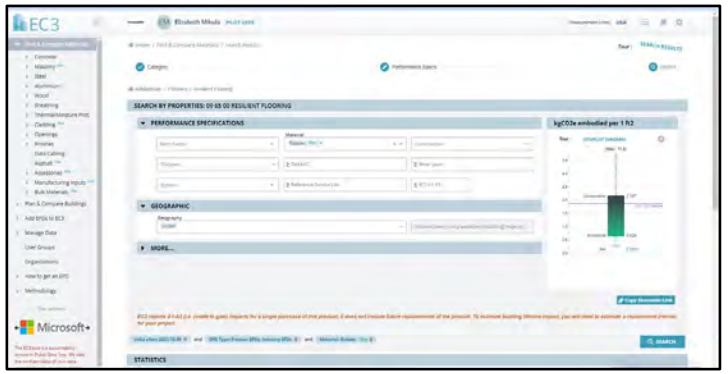
Low Carbon Labs



Model in Revit

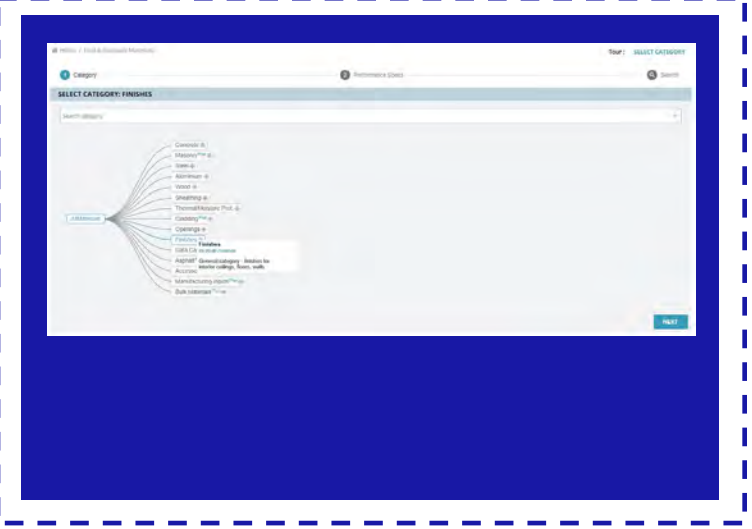


Import to EC3 from BIM360

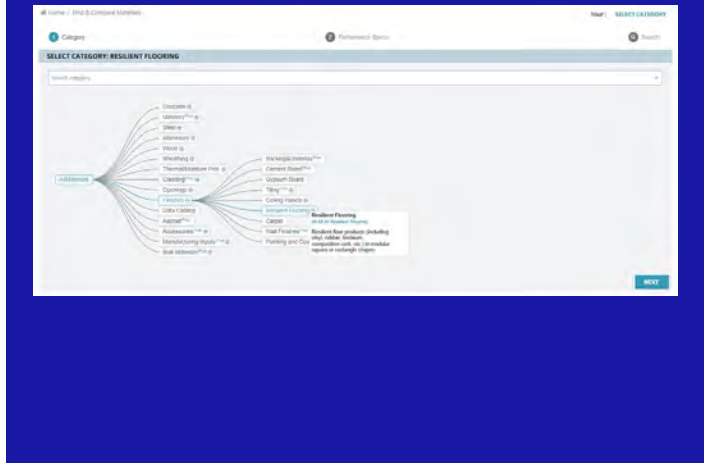


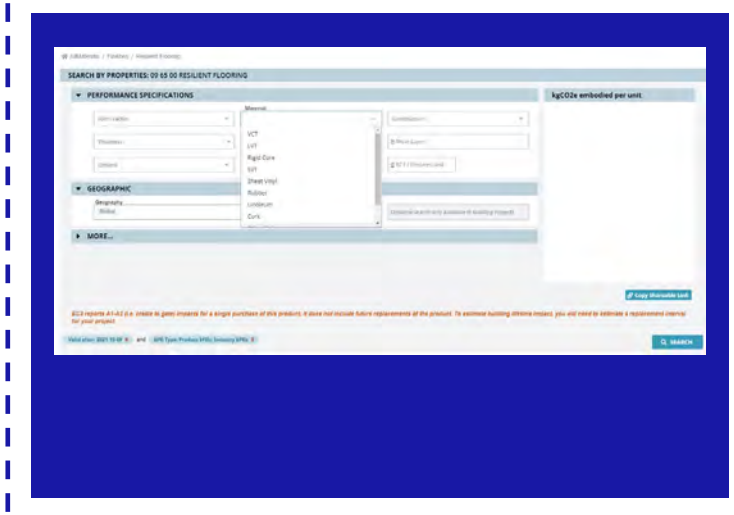
Assign Materials and Compare Options in EC3

Low Carbon Labs



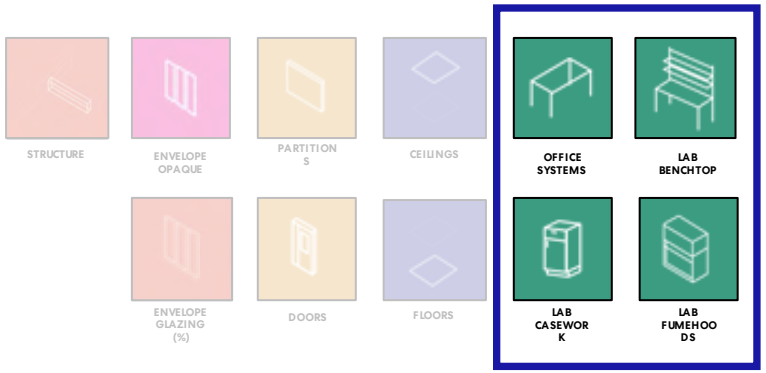
Material Categories currently available in EC3 cover some, but not all categories relevant to an embodied carbon in laboratories analysis. (even with Pilot program access)



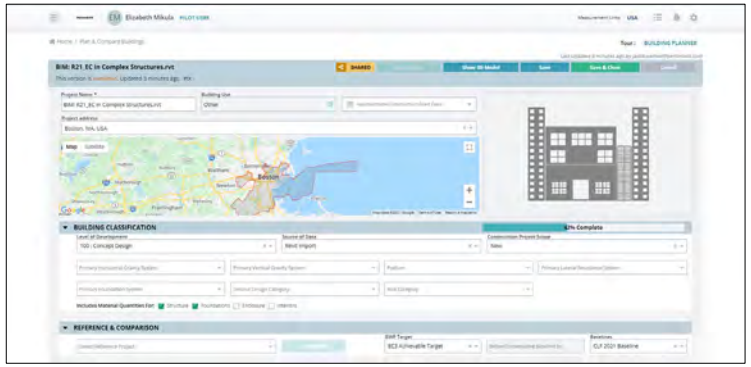


For available categories, material options currently available in EC3 do not yet include the laboratory finishes typically specified.

EC3



Similar to Tally, challenges with lack of systems and lack of options within systems.



EC3 tool is aimed for use during a specific phase of the construction process; the level of information required for input is often not available early in design phases.

Formatting information for option comparison is difficult.

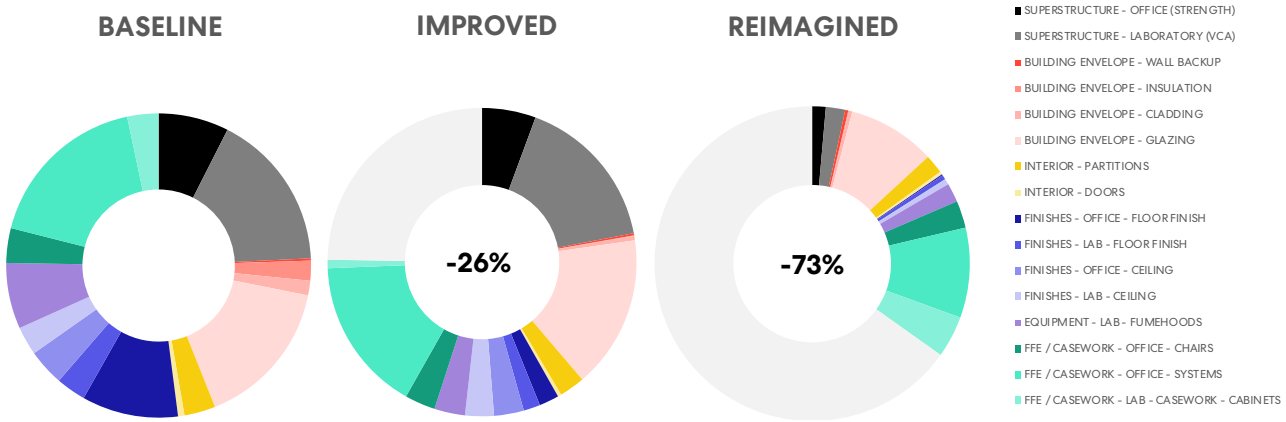
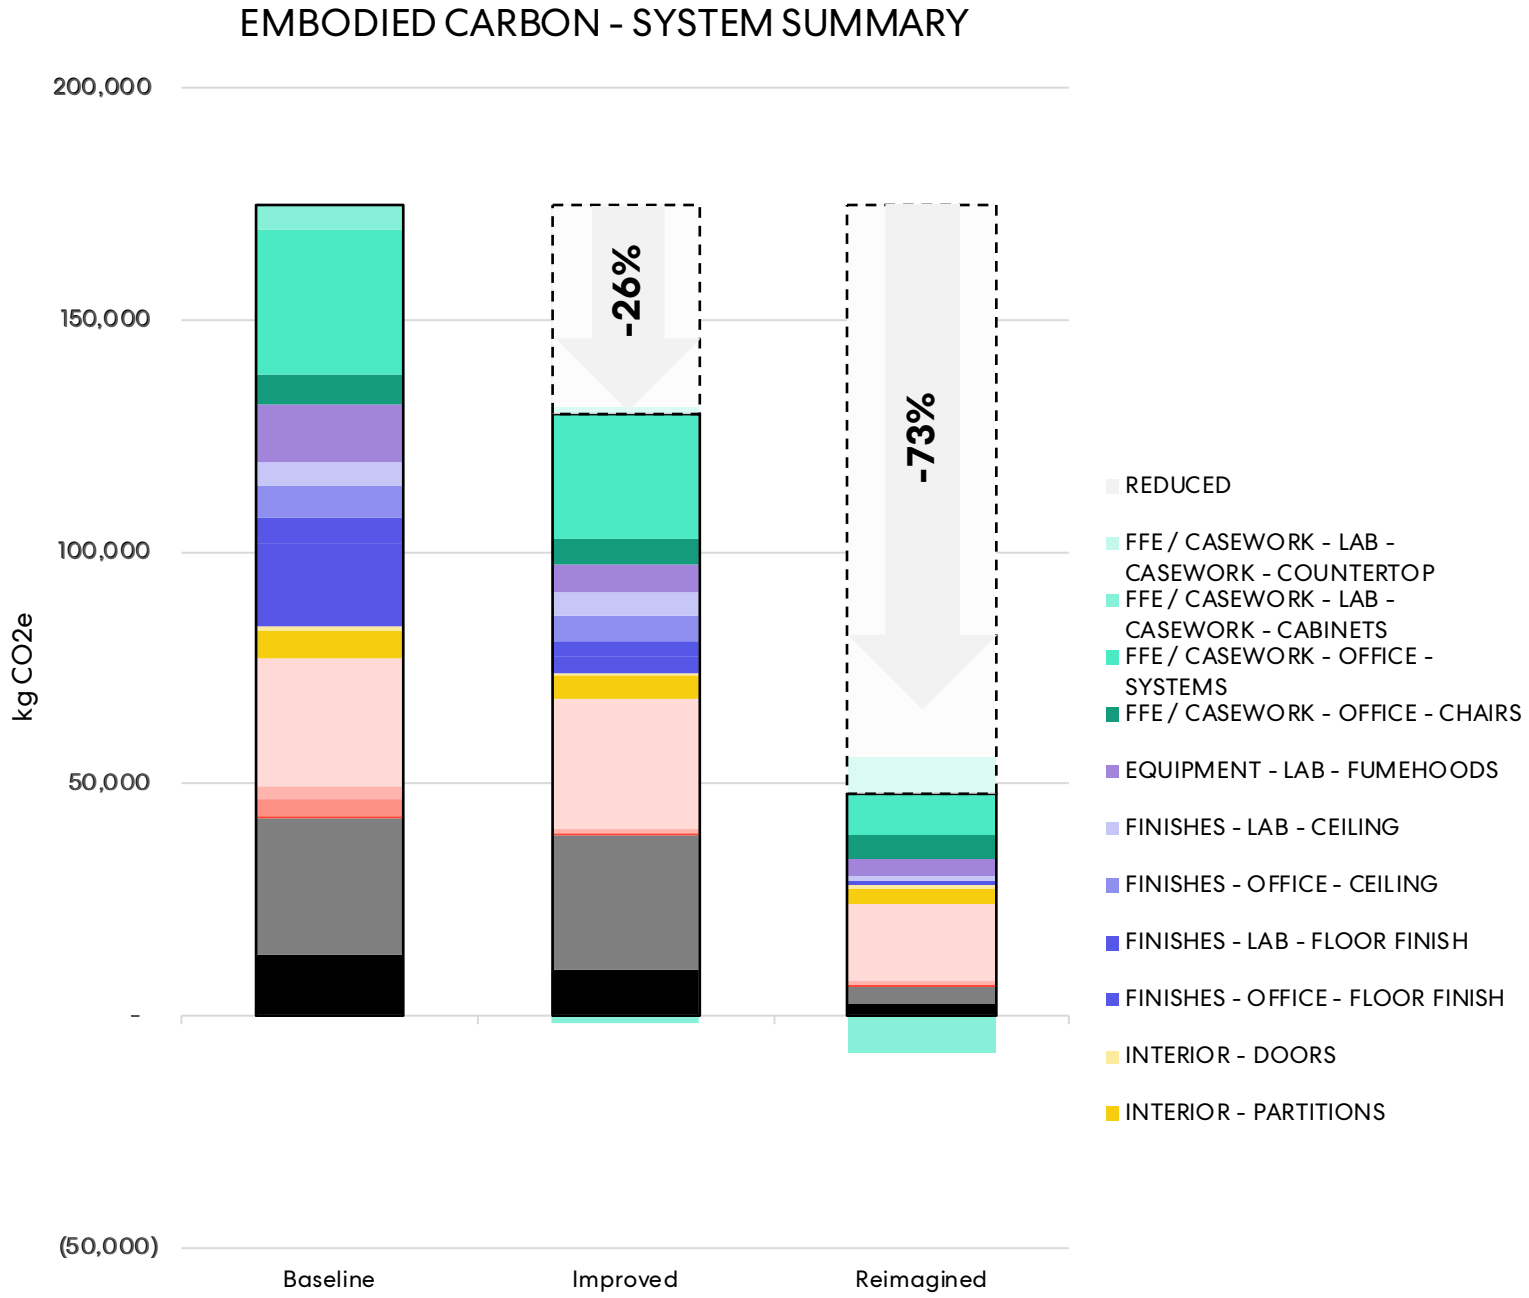
REDUCED	-	45,276	127,060



Data Summary



Data Summary

Note: the "module" represents "net" program area of lab space. A real building would contain "gross" areas such as corridors, stairways, mechanical spaces, and storage. These may equate to 35-50% of the total building area included in the operational carbon assessments. So, the comparison of embodied carbon reduction to operational carbon may be diluted by a similar factor in practice.

Scope and Strategy

Low Carbon Labs

Module for Analysis

Laboratory design planning follows a "best practice" planning standard - a module based on 11'-0". For the purposes of this study, a 22'-0" wide module was selected. Extending in the opposite direction, modules of 22'-0" (Laboratory Support), 33'-0" (Laboratory) and 33'-0" (Office/Write Up)

Programmatically the module for analysis chosen includes lab , lab support, and office/write up.

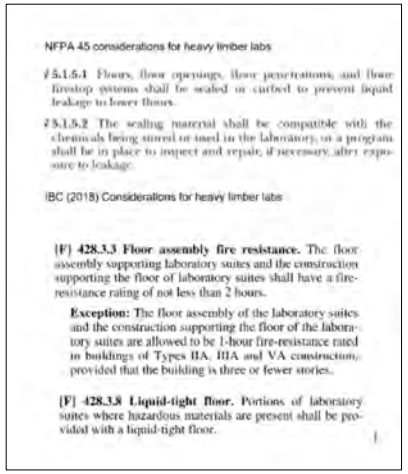
Code Pathways Currently Available:

Prescriptive & Performance Based



NFPA 45 considerations for heavy timber labs

5.1.5.1 Floors, floor openings, floor penetrations, and floor firestop systems shall be sealed or curbed to prevent liquid leakage to lower floors.

5.1.5.2 The sealing material shall be compatible with the chemicals being stored or used in the laboratory, or a program shall be in place to inspect and repair, if necessary, after exposure to leakage.

IBC (2018) Considerations for heavy timber labs

[F] 428.3.3 Floor assembly fire resistance. The floor assembly supporting laboratory suites and the construction supporting the floor of laboratory suites shall have a fire-resistance rating of not less than 2 hours.

Exception: The floor assembly of the laboratory suites and the construction supporting the floor of the laboratory suites are allowed to be 1-hour fire-resistance rated in buildings of Types IIA, IIIA and VA construction, provided that the building is three or fewer stories.

[F] 428.3.8 Liquid-tight floor. Portions of laboratory suites where hazardous materials are present shall be provided with a liquid-tight floor.

07 44 50	EXTERIOR	CLADDING	FIBER CEMENT CLADDING	Large-size fibre cement plates Swisspearl	The EPD refers to three types of large-size fibre cement plates that are produced in the plants of Swisspearl Group AG in Switzerland Eternit (Schweiz) AG, Niederurnen, Austria Eternit Österreich GmbH, Vöcklabruck and FibreCem Deutschland GmbH Porschendorf. Proportionally, about 90 % of large-size fibre cement plates are produced in Switzerland and Austria. Three average products from the two plants are declared. Thus, the EPD is representative of the large-size plates of Swisspearl Group AG.	https://www.swisspearl.com/fileadmin-customer-service/Technical/EPD_DoP/EPD005_Swisspearl-EN_2023.pdf

CMU	Manuctured Concrete and Concrete Masonry Products (UN CPC 3755)	Product Specific		The ASTM PCR for concrete and concrete masonry products only covers the cradle-to-gate life-cycle stages. Therefore, the declared unit for this EPD is one (1) yd3 of concrete formed into manufactured concrete and concrete masonry products. The EPD may be presented additionally per one (1) yd3 of concrete. This EPD covers only the cradle-to-gate impacts of manufactured concrete and concrete masonry products using a declared unit, and the results cannot be used to compare between products.	Volume	1 cu yd	0.001203814			75	
CMU 2	Manuctured Concrete and Concrete Masonry Products (UN CPC 3755)	Product Specific		The ASTM PCR for concrete and concrete masonry products only covers the cradle-to-gate life-cycle stages. Therefore, the declared unit for this EPD is one (1) m3 of concrete formed into manufactured concrete and concrete masonry products. The EPD may be presented additionally per one (1) yd3 of concrete.	Volume	1 cu yd	0.001203814			75	
Partitions	SCS PCR for Designated Steel Construction Products v1 2015	Product Specific		The declared unit for an EPD is one metric ton of steel construction product.	Mass	1 metric tonne					
Cold Formed Steel Framing Systems	UL Part B: Designated Steel Construction Product EPD Requirements, v2.0 (August 26, 2020)	Product Specific		The declared unit of calculation is one metric ton of Cold-formed steel product (1000kg)	Mass	1 metric tonne	1.36723E-05			30	
LVL	FPInnovations: 2015. Product Category Rules (PCR) for preparing	Product Specific		The declared unit is 1 m³ of LVL.	Volume	1 m³	0.000204391			75	
Stora Enso LVL (Laminated Veneer Lumber)	Standards EN 15804 and EN 16485 provide the core product category rules for the assessment. Standard EN 15942 provides the communication format for EPD. Biogenic carbon content of wood is calculated in line with EN 16449 standard.	Product Specific		1 m³ of LVL with a moisture content of 9%	Volume	1 m³	0.000204391			75	
Nordic X-Lam CLT	PCR: North American Structural and Architectural Wood Products v2. June 2015 (Interim Version).	Product Specific								75	
Rockwool Cavityrock	Product Category Rules Part A: Calculation Rules for the Life Cycle Assessment and Requirements on the Background Report, Product Category Rules Part B: Mineral insulating materials	Product Specific		1 M2 of stone wool thermal insulation product with an RD=1 m2k/w (R = 5.68)	Area	1 m²	1			30	
FOAMULAR Extruded Polystyrene (XPS) Insulation	Part B: Building Envelope Thermal Insulation EPD Requirements	Product Specific		The functional unit is 1 m2 of insulation material with a thickness that gives an average thermal resistance of RSI = 1m2·K /W (R = 5.678) and with a building service life of 60 years.	Area	1 m²	1			60	
Neopor Plus Graphite Polystyrene Insulation	ISO 21930:2017 and EN 15804:2012-04 serve as the core PCR along with Product Category Rules for Building-Related Products and Services; Part A (Standard 10010 version 3.1 4 th edition, May 2, 2018) and Product Catgory Rule (PCR) Guidance for Building-Related Products and Services; Part B: Building Thermal Insulation EPD Requirements UL 10010-1 (2 nd edition, April 10, 2018). Sub-category PCR was reviewed by Thomas Gloria, Phd (Chair), Industrial Ecology Consultants; Christoph Koffler, Phd, thinkstep and Andre Desjarlais, Oak Ridge National Laboratory.	Product Specific		1 m2 of installed Neopor® Plus Graphite Polystyrene Type I insulation material with a thickness that gives an avg. thermal resistance (RSI) of 1 m2*K/W (5.68 ft2*hr.*F/BTU per inch) with a building service life of 75 yrs. (packaging included)	Area	1 m²	1			75	
Spray Polyurethane Foam Insulation (HFC)	Part A: Product Category Rules for Building Related Products and Services (UL Environment, 2018) · Part B: Building Envelope Thermal Insulation EPD Requirements (UL Environment, 2018)	Industry Wide		1 m² of installed insulation material with a thickness that gives an average thermal resistance RSI=1 m2·K/W (R = 5.678)	Area	1 m²	1			75	
Spray Polyurethane Foam Insulation (HFO)	Part A: Product Category Rules for Building Related Products and Services (UL Environment, 2018) · Part B: Building Envelope Thermal Insulation EPD Requirements (UL Environment, 2018)	Industry Wide		1 m² of installed insulation material with a thickness that gives an average thermal resistance RSI=1 m2·K/W (R = 5.678)	Area	1 m²	1			75	
GreenGirt	Construction products and construction services (2012) v2.3	Product Specific		One linear foot (1Lft) of GREENGirt	Area	1 ft	0.09290304			75	
ALUMINUM SPECIALTY PRODUCTS AN INDUSTRY-AVERAGE ENVIRONMENTAL PROFILE	Institute Construction and Environment e.V. (IBU), 2014. PCR Guidance-Texts for Building-Related Products and Services. Part B: Requirements on the EPD for Metal Ceilings, Version 1.6, 2014. UL Environment Addendum- Product Category Rules for preparing an environmental product declaration (EPD) for PCR: IBU Product Category Rules, Part B: Requirements on the EPD for Metal Ceilings, October 2013. Version 1, 2014.	Industry Wide		The declared unit for this EPD is 1 kg of aluminum specialty product. Note that ceiling grid is not included in the definition of aluminum specialty product. Due to the participation of multiple manufacturers and the often-customized nature of the products, it is not meaningful to declare a reference panel that is accurate for all participating manufacturers. Therefore mass was chosen as the extensive property to normalize energy, materials, and impact assessment results.	Mass	1 kg	0.009171094	1.00		75	
Terrart	PCR part B: Requirements relating to the EPD for ceramic panellings, 1.6, 07.2014, Institut Bauen und Umwelt e.V., 2014	Product Specific		1 m² of ceramic façade panel	Area	1 m²	1			75	
Metal Composite Panel System	UL Part B: Insulated Metal Panels, Metal Composite Panels, and Metal Cladding: Roof and Wall Panels, v2.0 October 23 2018	Industry Wide		The main purpose of metal cladding and panels is to provide weather protection for building walls and roofs. The panels create barriers that control noise, water, and air transmission between an external environment and interior building space. Accordingly, the PCR's functional unit for metal panels, metal composite panels, and metal cladding is the coverage of 100 square meters (1076.4 square feet) of building area. The coverage area refers to the projected flat area covered by the product as output by the final manufacturing process step and does not account for losses due to overlap and scrap during installation.	Area	100 m²	0.01			75	
Large-size fibre cement plates Swisspearl	Fibre cement / Fibre concrete, 07.2014 (PCR tested and approved by the independent council of experts (SVR))	Product Specific		The life-cycle assessment refers to 1 ton of fibre cement plates							
EQUITONE (Linea / Lunara) fibre cement sheets	Fibre cement / Fibre concrete, 07.2014 (PCR checked and approved by the SVR)	Product Specific		The production of 1 m2 of an "EQUITONE [Linea / Lunara]" fibre cement sheets with a thickness of 10mm, and it's related impacts over cradle-to-grave life cycle stages, where the product's expected average reference service life is of 50 years.	Area	1 m²	1			50	
Typical Western Red Cedar Bevel Siding	North American Structural and Architectural Wood Products UNCPC 31, NAIC 321,v2. June 2015. Prepared by FPInnovations and available at www.fpinnovations.ca. PCR panel chaired by Thomas P. Gloria.	Industry Wide		1m2 of siding assumed installed over a wood-frame wall.	Area	1 m²	1			50	
James Hardie FIBRE CEMENT CLADDING	The International EPD® System's PCR 2012:01 Construction products and Construction services, Version 2.3, 2018-11-15	Product Specific		1 square metre (1m2)	Area	1 m²	1			50	
Optima Aluminum Framed Doors	The CEN standard EN 15804 serves as the core PCR	Product Specific		The declared unit is a single door, width 990mm; height 2.60m, glass thickness 12mm in single-glazed, 8mm + 6mm in double-glazed. The declared unit includes a typical set of door hardware: a lock, handles, hinges, and a door closer/spring. Indicator values are declared separately for double-glazed doors and single-glazed doors. For the reference product, the mass of the declared unit is 91kg for the single-glazed door and 105kg for the double-glazed door. The minimum mass of a single-glazed door of the specified dimensions is 72kg (10mm glass); its maximum is 100kg (12mm glass). The minimum mass of double-glazed door of the specified dimensions (6mm + 6mm glass) is 84kg; its maximum is 127kg (both faces in 8mm glass).	Count	1 Door				30	
Assa Abloy Legion / UltraDor Doors	Commercial Steel Doors and/or Frames 9005	Product Specific		The declaration refers to the functional unit of 1 unit (or piece) of ASSA ABLOY Legion / UltraDor Doors	Count	1 Door		51.40		30
